

User story name: <Contact (user)>

As a registered account (that has been created in database) , I want to login to be an authenticated account. As an authenticated account, I want to use all functions that have been pointed under my decentralization. As a user, I want to contact or send message to store for bussiness purpose.

I. List all Category

1. Contact

➤ Requirement

As a user, I want to contact or send message to store for bussiness purpose. After accessing the homepage, I click on the contact on navigation bar. A new page display with form for me can input.

After input all field in form, t can press “send” button to send it into admin.

➤ Dev task

The solution is to create a function that will follow this event flow

- User access login page
- System show login card
- User input login information for system verify
- Of wrong information, system will notify and require user re-input
- Login Successfully
- User can access the contact page
- All field need to full fill
- User can click on “send” button
- System query the database and add into contact table and display in contact manager page.
- User input information they want to ask
- A notification displays when user click “send” button.

➤ Acceptance Criteria:

- Blank to type username, password.
- Check with database to verify the account admin
- Deny request to log in if check whether username’s wrong or password’s wrong. Notice the user to let them know the situation.

- Re-direct to confirm email page to get the new password.
- Notification will show in necessary cases.
- System receive successfully transaction

➤ ***Definition of Done:***

- Passes all regression tests.
- Passes SQL injection test.
- Could type user name, password and verify it
- If verification is success, user could log in into system. If failed, they have to re-type or re-confirm the email.
- Display contact for users
- Submit information from users into database.
- Receive exactly information and store in database
